Simon Fraser University), has executed the perfect revision--he has updated examples, applications and theory without changing the elegant, precise presentation style of Alpha Chiang.

For this fourth edition of a text for students of economics, Chiang (University of Connecticut) and Wainwright (British Columbia Institute of Technology) add new chapters on the envelope theorem, advanced topics in optimization, and optimal control theory, and delete a chapter on mathematical programming. The book can serve as a text for a course o

In this text, Dr. Chiang introduces students to the most important methods of dynamic optimization used in economics. The classical calculus of

variations, optimal control theory, and dynamic programming in its discrete form are explained in the usual Chiang fashion, with patience and thoroughness. The economic examples, selected from both classical and recent literature, serve not only to illustrate applications of the mathematical methods, but also to provide a useful glimpse of the development of thinking in several areas of economics.

Intended for Mathematical Economics course, this text teaches the basic mathematical methods indispensable for understanding economic literature. It contains patient explanations written in an informal style.

Under the assumption of a basic knowledge of algebra and analysis,

micro and macro economics, this self-contained and self-sufficient textbook is targeted towards upper undergraduate audiences in economics and related fields such as business, management and the applied social sciences. The basic economics core ideas and theories are exposed and developed, together with the corresponding mathematical formulations. From the basics, progress is rapidly made to sophisticated nonlinear, economic modelling and real-world problem solving. Extensive exercises are included, and the textbook is particularly well-suited for computer-assisted learning.

An economics-focused introduction to the mathematical foundations of the field.

undergraduates provides a thorough  
and self-contained treatment of all the  
mathematics commonly taught in  
honours degree economics courses. It  
is suitable for use with students with  
and without A level mathematics.

A textbook for a first-year PhD course  
in mathematics for economists and a  
reference for graduate students in  
economics.

Economics students will welcome the  
new edition of this excellent textbook.  
Mathematics is an integral part of  
economics and understanding basic  
concepts is vital. Many students come  
into economics courses without having  
studied mathematics for a number of  
years. This clearly written book will

help to develop quantitative skills in even the least numerate student up to the required level for a general Economics or Business Studies course. This second edition features new sections on subjects such as: matrix algebra part year investment financial mathematics Improved pedagogical features, such as learning objectives and end of chapter questions, along with the use of Microsoft Excel and the overall example-led style of the book means that it will be a sure fire hit with both students and their lecturers.

A new edition of a student text which provides a broad study of optimization methods. It builds on the base of simple economic theory, elementary linear algebra and calculus, and reinforces each new mathematical
