Basic life support certification provides evidence that an individual has undergone basic life support training. Having basic life support certification streamlines communication with other responders in an emergency situation because it tells them what procedures you are, and are not, qualified to perform. When someone has basic life support certification, it shows that they know how to perform chest compressions that pump blood around the body to keep the tissues and brain supplied with ...

Cardiac arrest can strike a seemingly healthy individual of any age, race, ethnicity, or gender at any time in any location, often without warning. Cardiac arrest is the third leading cause of death in the United States, following cancer and heart disease. Four out of five cardiac arrests occur in the home, and more than 90 percent of individuals with cardiac arrest die before reaching the hospital. First and foremost, cardiac arrest treatment is a community issue - local resources and personnel must provide appropriate, high-quality care to save the life of a community member. Time between onset of arrest and provision of care is fundamental, and shortening this time is one of the best ways to reduce the risk of death and disability from cardiac arrest. Specific actions can be implemented now to decrease this time, and recent advances in science could lead to new discoveries in the causes of, and treatments for, cardiac arrest.

However, specific barriers must first be addressed. Strategies to Improve Cardiac Arrest Survival examines the complete system of response to cardiac arrest in the United States and identifies opportunities within existing and new treatments, strategies, and research that promise to improve the survival and recovery of patients. The recommendations of Strategies to Improve Cardiac Arrest Survival provide high-priority actions to advance the field as a whole. This report will help citizens, government agencies, and private industry to improve health outcomes from sudden cardiac arrest across the United States.

**Introduction and Objectives** Early bystander cardiopulmonary resuscitation (CPR) improves outcomes after cardiac arrest. (1,2) Bystander CPR rate can be increased by offering training to potential lay rescuers. (3) Brayden's Illuminating CPR Manikin offers a new approach to training with real-time feedback. The primary objective was to ascertain if candidates' hands off time and chest compression performance varies according to type of training manikin used. **Materials and Methods** Following a pilot/feasibility phase to estimate sample size, this randomised controlled trial was conducted as part of the University of Birmingham's European Resuscitation Council (ERC) Basic Life Support (BLS) provider courses between

October 2017 and April 2018 (see Figure 1). (4) Following randomisation, approximately half of enrolled students were trained using Brayden Illuminating CPR Manikins, and half using Laerdal Little Anne CPR Training manikins. All participants received a pass/fail grade at the end of their course and detailed reasons for failures were recorded. Quantitative CPR measurements (Laerdal Resusci Anneu00ae Wireless SkillReporter) (4) were taken at week 2 of each course and immediately post-testing. Statistical analysis was conducted using R v.3.5.0. Results 168 participants were enrolled into the study, 86 in the Brayden arms and 82 in the Laerdal arms. There was no difference between quantitative CPR performance measured via SkillReporter during or after CPR training between the two groups . There were no significant differences in exam failure rates due to compressions or hand positioning in either group. However, fewer people had difficulties with chest compression rate in the Brayden group (10 (59%) vs 9 (90%). There was no statistically significant difference in CPR performances between groups. Conclusions Brayden Illuminating CPR manikins are equivalent to Laerdal Mini Anne manikins when used to train a highly motivated cohort of University students. Future work is underway to investigate their use in schoolchildren and as an adjunct during refresher training.

skills needed to manage medical emergencies in the dental office or clinic. It describes how to recognize and manage medical emergencies promptly and proactively, and details the resources that must be on hand to deal effectively with these situations. This edition includes new guidelines for drug-related emergencies, cardiac arrest, and more. Written by respected educator Dr. Stanley Malamed, this expert resource provides dental professionals with the tools for implementing a basic action plan for managing medical emergencies. "It successfully fulfils its aim of stimulating all members of the dental team to improve and maintain their skills in the effective prevention, recognition and management of medical emergencies." Reviewed by European Journal of Orthodontics, March 2015 "...very easy to read and provides a very comprehensive reference for a variety of medical emergencies." Reviewed by S.McKernon on behalf of British Dental Journal, July 2015 A logical format reflects the way emergencies are encountered in a dental practice, with chapters organized by commonly seen clinical signs and symptoms, such as unconsciousness or altered consciousness, respiratory distress, seizures, drug-related emergencies, chest pain, and cardiac arrest. Step-by-step procedures include detailed, numbered instructions for stabilizing and treating victims (PCABD) in common medical emergencies. Full-color illustrations demonstrate emergency

techniques in realistic clarity. Summary tables and boxes make it easy to find essential concepts and information. Quick-reference algorithms in the appendix include step-by-step diagrams showing the decision-making process in common emergency situations. A differential diagnosis chapter ends each of the book's parts on common emergencies. UPDATED content includes the most current guidelines for drug-related emergencies, unconsciousness, altered consciousness, and cardiac arrest as well as protocols for obstructed airway management. UPDATED PCABD boxes reflect the American Heart Association's new sequence of steps for stabilizing and treating victims with an easy-to-remember acronym: Positioning, Circulation, Airway, Breathing, and Definitive Management. UPDATED! Emergency drug and equipment kit instructions help you assemble emergency kits and ensure that your dental office has safe, current materials on hand.
