This book is based on an honors course in advanced calculus that the authors gave in the 1960's. The foundational material, presented in the unstarred sections of Chapters 1 through 11, was normally covered,

but different

applications of this basic material were stressed from year to year, and the book therefore contains more material than was covered in any one year. It can accordingly be used (with omissions) as a text for a year's course in advanced calculus, or as a text

prerequisites are a

good grounding in

the calculus of one

some acquaintance

with linear algebra.

The reader should be

familiar with limit

and continuity type arguments and have a certain amount of mathematical

sophistication. As possible introductory texts, we mention Differential and Integral Calculus by R Courant, Calculus by T Apostol, Calculus by M Spivak, and Pure Mathematics by G Hardy. The reader

should also have
some experience
with partial

derivatives. In overall
plan the book divides
roughly into a first
half which develops
the calculus

(principally the
differential calculus)

in the setting of
normed vector
spaces, and a second
half which deals with
