cause of earthquakes was little understood. Those who did look for natural causes often reached conclusions that seem fanciful today; one popular theory was that earthquakes were caused by air rushing out of caverns deep in the Earth's interior. The earliest earthquake for which we have descriptive information occurred in China in 1177 B.C. The Chinese earthquake catalog describes several dozen large earthquakes in China during the next few thousand years. Earthquakes in Europe are mentioned as early as 580 B.C., but the earliest for which we have some descriptive information occurred in the mid-16th century. The earliest known earthquakes in the Americas were in Mexico in the late 14th century and in Peru in 1471, but descriptions of the effects were not well documented. By the 17th century, descriptions of the effects of earthquakes were being published around the world—although these accounts were often exaggerated or distorted. The most widely felt earthquakes in the recorded history of North America were a series that occurred in 1811-12 near New Madrid, Mo. A great earthquake, whose magnitude is estimated to be about 8, occurred on the morning of December 16, 1811. Another great earthquake occurred on January 23, 1812, and a third, the strongest yet, on February 7, 1812. Aftershocks were nearly continuous between these great earthquakes and continued for months afterwards. These earthquakes were felt by people as far away as Boston and Denver. Because the 3 most intense effects were in a sparsely populated region, the destruction of human life and property was slight. If just one of these enormous earthquakes occurred in the same area today, millions of people and buildings and other structures worth billions of dollars would be affected. The San Francisco earthquake of 1906 was one of the most destructive in the recorded history of North America—the earthquake and the fire that followed killed nearly 700 people and left the city in ruins. The Alaska earthquake of March 27, 1964, was of greater magnitude than the San Francisco earthquake; it released perhaps twice as much energy and was felt over an area of almost 500,000 square miles. The ground motion

near the epicenter was so violent that the tops of some trees were snapped off. One hundred and fourteen people (some as far away as California) died as a result of this earthquake, but loss of life and property would have been far greater had Alaska been more densely populated. This two-volume set explores disasters that occurred around the world. The disasters are listed chronologically, beginning with the Supervolcano in Toba, Indonesia in 74000 B.C. and ending with the Greensburg, Kansas tornado in 2007. The entries are detailed and informative and provide the exact causes of each event, whether it was an environmental catastrophe or a human tragedy.

A comprehensive overview of a catastrophic earthquake which occurred at Tangshan in northeastern China in 1976. In addition to a presentation of various aspects of the earthquake, including the geological structures of the area, a history of the seismicity, and the various hazards from an engineering viewpoint, the sociological problems are also discussed. The book presents the results of 20 years research by Chinese scientists, in the field of earthquake prediction, and notes the difficulties they are still facing.

Dynamic Earth presents the principles of convection in the earth's mantle in an accessible style. Mantle convection is the process underlying plate tectonics, volcanic hotspots and, hence, most geological processes. The book summarises key observations and presents the relevant physics starting from basic principles. The

main concepts and arguments are presented with minimal mathematics, although more mathematical versions of important aspects are included for those who desire them. The book also surveys geochemical constraints and mantle evolution. The audience for Geoff Davies' book will be the broad range of geologists who desire a better understanding of the earth's internal dynamics, as well as graduate students and researchers working on the many aspects of mantle dynamics and its implications for geological processes. It is also suitable as a text or supplementary text for upper undergraduate and postgraduate courses in geophysics, geochemistry, and tectonics.

Explores how an unlikely collection of scientists, psychics, and doomsday prophets have made accurate earthquake predictions based on a wide range of empirical and otherworldly signs, observing how the practice of earthquake prediction reflects a human need for control. 20,000 first printing.

This how-to manual for life in earthquake country describes California's violent geologic past and recounts the state's revolutionary efforts to grapple with the earthquake threat. It examines major faults that threaten California and Nevada, reviews the current level of earthquake preparedness and disaster response, and suggests actions that citizens can take to protect their families and homes. Topics discussed include earthquake forecasting, catastrophe insurance, and tsunamis. Yeats is professor emeritus in the geosciences department at Oregon State University. c. Book News Inc.
