Electric motors have a rated horsepower (HP) that is determined by the amount of torque they can produce at their running or baseline speed. The nameplate shown in Figure 1 indicates this motor is rated at 1 horsepower. The term "horsepower" comes from the rating of steam engines. Many years ago, James Watt invented the steam engine.

When only a few geographically dispersed AC motors are used, the circuit protection and control components may be located in a panel near the motor. Motor Control Centers (MCC) In many commercial and industrial applications, quite a few electric motors are required, and it is often desirable to control some or all of the motors from a central location.

There are magnets attached to both an external stationary stator, and an internal rotor. The rotor is able to move because the current is reacting to the magnetic poles, creating a rotating magnetic field. There are many different types of AC motors, and the most common ones are mentioned below: Induction Motors, also known as asynchronous motors, rely solely on AC as a power source. An induced current occurs in the rotor conductors and is caused by the interaction between the rotor and the ...
