2011. The internal combustion engine is produced in tens of millions per year for applications as the power unit of choice in transport and other sectors. It continues to meet both needs and challenges through improvements and innovations in technology

and advances from the latest research. These papers set out to meet the challenges of internal combustion engines, which are greater than ever. How can engineers reduce both CO<sub>2</sub> emissions and the dependence on oil-derivate fossil fuels? How will

they meet the future, more stringent constraints on gaseous and particulate material emissions as set by EU, North American and Japanese regulations? How will technology developments enhance performance and shape the next

generation of designs? This conference looks closely at developments for personal transport applications, though many of the drivers of change apply to light and heavy duty, on and off highway, transport and other sectors. Aimed at anyone

with interests in the internal combustion engine and its challenges The papers consider key questions relating to the internal combustion engine

An experimental study was performed to assess the feasibility of performing methane ( $\text{CH}_4$ ) partial oxidation (POX) in two internal combustion engines: one equipped to perform spark-ignition (the "spark-ignited engine"), and the other containing

# Download Ebook Engine Lister Petter

a catalyst in the engine cylinder (the "catalytic engine"). The exhaust gases were rich in hydrogen- ( $H_2$ ) and carbon monoxide- (CO), and could be used as synthesis gas ("syngas") for the synthesis of liquid fuels such as methanol. Conventional

## Lister Petter

syngas production techniques are only economical on a large scale and cannot be transported to hard-to-reach gas sources, where gas-to-liquids (GTL) would have the biggest impact on the transportability of that gas. Engines could be deployed at

# Download Ebook Engine Lister Petter

these locations to produce syngas on a small scale and at low cost, as they benefit from the economies of mass production that have been achieved through advanced manufacturing techniques. We call this type of engine an "engine reformer". This

# Download Ebook Engine Lister Petter

thesis contrasts the results of performing methane POX in two different engine reformers, using atmospheric air as the oxidizer. One of four cylinders in a Yanmar 4TNV84T marine diesel generator was converted to ignite methane POX mixtures using a spark plug.

Intake temperatures  $> 350\text{ }^{\circ}\text{C}$  were required to minimize misfire. Exhaust  $\text{H}_2$  to  $\text{CO}$  ratios of 1.4 were achieved with methane-air equivalence ratios (0m) up to 2.0, while ratios of  $> 2.0$  were achieved with hydrocarbon-air equivalence

ratios (PHC) up to 2.8 with the assistance of hydrogen ( $H_2$ ) and ethane ( $C_2H_6$ ). High equivalence ratios  $\phi_{PHC} > 2.2$  showed reduced  $CH_4$  conversion efficiency, therefore  $PHC = 2.2$  (with  $H_2$  produced a good tradeoff between syngas quality

and CH<sub>4</sub> conversion. A single-cylinder Lister-Petter TRI diesel generator was used to perform methane POX using a palladium (Pd) washcoat catalyst deposited on a Fecralloy® disk. With > 150 °C intake temperatures, exhaust H<sub>2</sub> to CO ratios of 1.0 were

achieved with methane-air equivalence ratios ( $\phi = 4.0$  with varying amounts of  $\text{CO}_2$  to simultaneously perform methane dry reforming. Spark-ignition appeared to provide higher reliability, though tests will continue to be performed on the

catalytic engine to optimize performance. A larger engine of a similar design to the spark-ignited Yanmar will be deployed at a demonstration plant in North Carolina to produce syngas at higher flow rates, and will be integrated with a liquids synthesis
