Project changes are often encountered in
construction industry and can hurt labor
productivity, which in turn can jeopardize
project success for all parties. Contractors
and owners frequently fail to agree on the
merit, responsibility and impact of changes
at the time of their occurrence. This failure

to agree becomes a major source of claims and litigation. There are several ways to calculate productivity loss caused by changes. One method to quantify loss of productivity is the MCAA (Mechanical Contractors Association of America) Factor method. The MCAA method has been in use for over forty years, and has gained wide acceptance in the construction industry and before various Courts and Boards of contract appeals. But the model has been rejected in several recent claims. Some researchers commented that this method has several deficiencies that limited its use. This

dissertation aims to make improvements to the existing MCAA model. We document the MCAA model's history, identify typical mistakes made in its application, and compare it with other studies and previous legal case decisions. Suggested improvements to the model are then offered. First, based on the observations and analysis of this dissertation, we recommend the following when using the MCAA model: 1) Establish causation for EACH Factor and explain clearly when, where, who, and how productivity was affected; 2) Use fewer Factors rather than more Factors; and 3) Do not blindly rely on

the Loss of Productivity (LOP) damage percentages contained in the MCAA manual. Secondly, this research proposes structural improvements on the MCAA model for its use in a LOP claim: 1) suggested use of a cause-effect visualization tool to establish causation; 2) improved definitions by explaining what each Factor means and how that Factor hinders labors productivity; and 3) suggestions for quantification of LOP impact for each Factor. Finally, this dissertation proposes procedures and guidelines to use the MCAA method in LOP analysis. This dissertation will help parties

(both the contractor and the owner) better understand the MCAA method in estimating productivity loss so that the measure of the loss of productivity can be less subjective and more transparent. With the improvements provided in this dissertation, LOP can be better quantified and LOP disputes can be solved more quickly and reasonably.

Companies live or die on the basis of estimating their costs. Preparing estimates and bidding for new jobs is a complex and often costly process. There is no substitute for on the job training -- until now. Drawing

on the authors' combined experience of more than 70 years, Estimating Building Costs presents state-of-the-art principles, practices, and techniques for assessing these expenditures that can be applied regardless of changes in the costs of materials, equipment, and labor. The book is an efficient and practical tool for developing contracts or controlling project costs. The authors cover the major components of the direct cost: estimating procedures and cost trends related to materials, construction equipment, and skilled and unskilled labor. They describe various types of building
