Geographic information in decision making often goes unnoticed, but it is actually very present in our daily activities. Our eBook Fundamentals of GIS: Applications with ArcGIS shows the potential of Geographic Information Systems (GIS) for geoprocessing and mapping using ArcGIS. This book is designed in a didactic and sequential way, as we advance in the development of the exercises we will acquire and improve our skills in the use of GIS tools, until we get to the publication of a well edited map. When the exercises in this book are completed and developed, the user will be able to fully understand the fundamentals of GIS, and the use of its main tools to generate maps. This is a book that will teach you from scratch and step by step the use of GIS for your professional projects.

This 8th edition features a major new case study developed to help illuminate the complexities of shafts and axles

Project approaches in engineering education are a relatively recent phenomenon in Portugal, Spain and Latin-America. Teachers, educational researchers and managers in engineering education are discovering the added value of team work, solving interdisciplinary open-ended problems in a meaningful learning environment that is similar to the professional context of future engineers. This book seeks to present a wide range of experiences of project approaches to engineering education, varying from mature to starting. It discusses different aspects of project approaches like project management, teacher training, assessment and institutional support. It also describes experiences taking place in a number of countries - Portugal, Brazil, the Netherlands, Denmark, Germany, Spain and Australia - in order to provide an overview of project approaches in different cultural backgrounds. It aims to encourage those who are considering project approaches in their own engineering education context, taking into account the advantages of training future engineers through project work, while being aware of the challenges that a shift from traditional education to a project may bring.

This book constitutes the refereed proceedings of the 7th International Conference on Concept Mapping, CMC 2016, held in Tallinn, Estonia, in September 2016. The 25 revised full papers presented were carefully reviewed and selected from 135 submissions. The papers address issues such as facilitation of learning; eliciting, capturing, archiving, and using "expert" knowledge; planning instruction; assessment of "deep" understandings; research planning; collaborative knowledge modeling; creation of "knowledge portfolios"; curriculum design; eLearning, and administrative and strategic planning and monitoring.

Whether different types of costs are to be reduced, benefits to be maximized or scarce resources to be managed, scheduling theory provides intelligent methods for practitioners and scientists. The just-in-time (JIT) production philosophy has enriched the classical scheduling theory with models that consider characteristics such as inventory costs, set-up times, lot sizing, or maintenance. This edited volume considers the specifics of just-in-time systems. It provides knowledge and insights on recent advances in scheduling theory where just-in-time aspects are considered. Contributions on models, theory, algorithms, and applications, that bring the theory up-to-date on the state-of-the-art of JIT systems are presented. Professionals, researchers and graduate students will find this book useful.
