The number e, known as Euler's number, is a mathematical constant approximately equal to 2.71828, and can be characterized in many ways. It is the base of the natural logarithm. It is the limit of (1 + 1/n)<sup>n</sup> as n approaches infinity, an expression that arises in the study of compound interest.It can also be calculated as the sum of the infinite series

The Natural History (Latin: Naturalis Historia) is a work by Pliny the Elder.It is one of the largest single works to have survived from the Roman Empire to the modern day and purports to cover all ancient knowledge. The work's subject area is thus not limited to what is today understood by natural history; Pliny himself defines his scope as "the natural world, or life".

Palms are widely regarded as a model group for tropical research. More than 90% of the 2,600 species are restricted to tropical rain forests. Recent research on their long evolutionary history, stretching back more than 100 million years, has shed light on the origins, and processes underpinning the origins of the world ' s rain forests.

Two *Prestoea montana* palm forest stands were studied in the Luquillo Experimental Forest over a period of 40 years in order to determine the successional status of the palm brake. The stand with the greater rainfall had fewer tree species, greater species dominance, and lower turnover of species than the stand with less rainfall.

Seed Biology: Insects, and Seed Collection, Storage, Testing, and Certification, Volume III brings together a large body of important information on seed biology. The book describes seed collection, identification, storage, testing, and certification. It also considers insects that directly affect seeds, seed-producing organs, or seed-bearing structures of plants. Organized into six chapters, this volume begins by outlining man ' s dependency on seeds as source of food, fiber, spices, beverages, oils, vitamins, and drugs. Harmful effects of seeds are also mentioned. Separate chapters focus on seed development, dissemination, germination (including metabolism, environmental control, internal control, dormancy, and seed and seedling vigor), protection from diseases and insects, longevity, and deterioration. The book concludes with a discussion on the certification of field and tree seeds, the Organization for Economic Cooperation and Development certification schemes, and trends in seed certification. This book is a valuable source of information for seed producers and users as well as various groups of research biologists and teachers, including agronomists, plant anatomists, biochemists, ecologists, entomologists, foresters, horticulturists, plant pathologists, and plant physiologists.

In Dates, Nawal Nasrallah draws on her experience of growing up in the lands of ancient Mesopotamia, where the date palm was first cultivated, to explore the history behind the fruit. Dates have an important role in their arid homeland of the Middle East, where they are a dietary staple and can be consumed fresh or dried, as a snack or a dessert, and are even thought to have aphrodisiac qualities. In this history, Nasrallah describes the central role the date palm has played in the economy of the Middle East. This informative account of the date palm ' s story follows its journey from its land of origin to the far-flung regions where it is cultivated today. Along the way, Nasrallah weaves many fascinating and humorous anecdotes that explore the etymology, history, culture, religion, myths, and legends surrounding dates. For example, she explains how the tree came to be a symbol of the Tree of Life and associated with the fiery phoenix bird, the famous ancient goddess Ishtar, and the moon, and how the medjool date acquired its name. This delightful and unusual book is generously illustrated with many beautiful images, and supplemented with more than a dozen delicious date recipes for savory dishes, sweets, and wine.

Hedrick contends that parables do not teach moral and religious lessons; they are not, in whole or part, theological figures for the church. Rather, parables are realistic narrative fictions that like all effective fiction literature are designed to draw readers into story worlds where they make discoveries about themselves by finding their ideas challenged and subverted--or affirmed. The parables have endings but not final resolutions, because the endings raise new complications for careful readers, which require further resolution. The narrative contexts and interpretations supplied by the evangelists constitute an attempt by the early church to bring the secular narratives of Jesus under the control of the church's later religious perspectives. Each narrative represents a fragment of Jesus's secular vision of reality. Finding himself outside the mainstream of parables scholarship, both ecclesiastical and critical, Hedrick explored a literary approach to the parables in a series of essays that, among other things, set out the basic rationale for a literary approach to the parables of Jesus. These early essays form the central section of the book. They are published here in edited form along with unpublished critiques of a thoroughgoing literary approach and his response.

The Ecology of Kalimantan is a comprehensive ecological survey of one of Indonesia's largest and most diverse islands. This book presents a complete summary of our current scientific knowledge about Borneo including the rainforest and riverine habitats that are endangered by logging and industrial development, along with a discussion of land use patterns and current problems. Kalimantan is the Indonesian portion of the huge island of Borneo. Kalimantan has played a key role in Indonesia ' s economic development and is a major earner of foreign revenue due to the island's rich natural resources: forests, oil, gas, coal, and other minerals. In this book the authors argue that Kaimantan can be developed, but within tight ecological constraints and with great care. This book remains a standard reference for scientists, anthropologists, writers, and anyone interested in the region.

In this substantial book, Gell guides the reader systematically through an analysis of the social structure, language and ritual of the Umedia-Punda connubium of the West Sepik district. One of the central areas explored is the ida fertility ritual and the decipherment and the unravelling of symbolic relationships between words of similar construction. One one side is the analysis on the temporal sequence of events (or ritual roles) metamorphosing the casswary (nature) into the 'new man' (culture) and the on other side, the associated 'harmonic levels' which allude to body painting, choreography and social status. His approach substantiates the view that the ritual is not so much about the establishing of linear causality in the relationship between a society and its environment, but with the 'an act of poetic legislation over the course of nature'.
