They supply energy and essential nutrients in the form of protein, vitamins, and minerals. Energy and protein are often the most limiting factors for ruminants and have received the most attention in evaluation systems. Some feed or food characteristics are related to form (e.g., particle size) and have no

Nutritional ecology of the ruminant ...

Ruminants are, without exception, obligate herbivores subsisting as they do on a diet composed entirely of plant material. However, plant material is a diverse resource and within the Ruminantia there is a range of feeding niches with different herbivore classes focussing their foraging effort on different vegetation types (Hofmann 1989).

rumen processes nutrients

whilst Part 4 explores nutritional strategies to optimise rumen function.

This volume investigates how large herbivores not only influence the structure and distribution of the vegetation, but also affect nutrient flows and the responses of associated fauna. The mechanisms and processes underlying the herbivores' behavior, distribution, movement and direct impact on the vegetation are discussed in detail. It is shown that an understanding of

can inform the management of large herbivores to integrate production and conservation in terrestrial systems.

This book addresses various aspects of in vitro digestibility:

- Application of meta-analyses and machine learning methods to predict methane production;
- Methane production of sainfoin and alfalfa;
- In vitro evaluation of different dietary methane mitigation strategies;
- Rumen methanogenesis, rumen fermentation, and microbial
