This full-colour atlas is designed for all students taking either separate or integrated courses in physiology and/or anatomy. The atlas can accompany or augment any human anatomy, human physiology or combined textbook, and should be of particular use in a laboratory situation, where it can stand alone as a laboratory manual.

A Photographic Atlas for the Biology Laboratory, Seventh Edition by Byron J. Adams and John L. Crawley is a full-color photographic atlas that provides a balanced visual representation of the diversity of biological organisms. It is designed to accompany any biology textbook or laboratory manual.

Biology is a visually-oriented science. This book is designed to give students colour photographs of organisms encountered in a biology course. It can accompany any biology text or laboratory manual used in the classroom and on certain courses replace them. The book provides a balanced visual representation of the five kingdoms of biological organisms, with completely labelled informative figures.

A Photographic Atlas of Marine Biology is a full-color supplement that provides photographs of preserved specimens and images taken at various aquaria to provide coverage of organisms in the world’s oceans. It is designed to accompany any marine biology text or laboratory manual.

Depicts structures in the same colours as they would appear in real life. Covers animals and plants

A Photographic Atlas of Histology, 2e by Michael J. Leboffe is designed for use in undergraduate histology and human anatomy courses. It serves as a convenient visual reference and is of particular value to students in a laboratory setting. Commercially available microscope slides are used to photograph, so images represent the quality and diversity of what a student is actually likely to encounter in the laboratory; pathological specimens have not been used.

This book is divided into two primary sections. The first covers plant anatomy and the second covers plant taxonomy.
