Neurological Rehabilitation is the latest volume in the definitive Handbook of Clinical Neurology series. It is the first time that this increasing important subject has been included in the series and this reflects the growing interest and quality of scientific data on topics around neural recovery and the practical applications of new research. The volume will appeal to clinicians from both neurological and rehabilitation backgrounds and contains topics of interest to all members of the multidisciplinary clinical team as well as the neuroscience community. The volume is divided into five key sections. The first is a summary of current research on neural repair, recovery and plasticity. The authors have kept the topics readable for a non-scientific audience and focused on the aspects of basic neuroscience that should be most relevant to clinical practice. The next section covers the basic principles of neurorehabilitation, including excellent chapters on learning and skill acquisition, outcome measurement and functional neuroimaging. The key clinical section comes next and includes updates and reviews on the management of the main neurological disabling physical problems, such as spasticity, pain, sexual functioning and dysphagia. Cognitive, emotional and behavioural problems are just as important and are covered in the next section, with excellent chapters, for example, on memory and management of executive dysfunction. The final part draws the sections on symptom management together by discussing the individual diseases that are most commonly seen in neurorehabilitation and providing an overview of the management of the disability associated with those disorders. The volume is a definitive review of current neurorehabilitation practice and will be valuable to a wide range of clinicians and scientists working in this rapidly developing field. A volume in the Handbook of Clinical Neurology series, which has an unparalleled reputation as the world's most comprehensive source of information in neurology

International list of contributors including the leading workers in the field Describes the advances which have occurred in clinical neurology and the neurosciences, their impact on the understanding of neurological disorders and on patient care

UPDATED! Color photos and line drawings clearly demonstrate important concepts and clinical conditions students will encounter in practice. NEW and EXPANDED! Additional case studies illustrate how concepts apply to practice. Updated chapters incorporate the latest advances and the newest information in neurological rehabilitation strategies. NEW and UNIQUE! New chapter on concussion has been added. Separate and expanded chapters on two important topics: Balance and Vestibular.

Neurorehabilitation for the Physical Therapist Assistant provides a complete overview of the foundations of various neurological medical conditions and presents a wide array of clinical problems that a physical therapist assistant may encounter in the educational or clinical setting. Darcy Umphred and Connie Carlson, along with 11 contributors, offer a thorough explanation of the PT to PTA delegation process that is both unique and comprehensive. Throughout the pages of Neurorehabilitation for the Physical Therapist Assistant the PTA is provided with the necessary tools to effectively interact with and treat patients who suffer from neurological medical diagnoses. This text also covers a wide variety of neurological clinical problems that a PTA may encounter. Neurorehabilitation for the Physical Therapist Assistant presents specific examples of tests and measures and interventions that a PTA may use when treating patients with CNS damage. Multiple chapters offer one or more case studies that will aid students and practicing PTAs in the analysis of PTA roles and the delegation of specific tasks, as well as why a PT may not choose to delegate a task. Also included is a brief discussion of selected pathologies and their progressions or complications, which gives the PTA a means to identify contraindications or changes in patient behavior that need to be reported. Features: -Interactive website access that provides the answers to the questions and case studies for each chapter. -A clear delineation of the differences between the frameworks used by medical practitioners and those used by the PT. -Detailed descriptions of tests and measures and interventions used by the PTA. -A focus on interactions between types of movement dysfunctions and intervention selection. -A discussion of disablement and enablement models. The volumes of knowledge presented in this unique and detailed text ensures Neurorehabilitation for the Physical Therapist Assistant will accompany the PTA throughout their education and into their career.

Changes in the focus of neurological practice worldwide have led to the need for new standard texts that reflect the current state of this expanding area of clinical expertise. The second edition of the Handbook of Neurological Rehabilitation is a major reference source that fulfils this need, providing an invaluable resource for all professions that work with patients suffering from neurological disorders. It brings restorative neurology to the bedside and shows how a reiterative, goal-oriented, problem-solving training programme can benefit patients, sometimes on a scale not achieved by pharmacological or surgical interventions. The book is divided into three sections all of which have been updated. Section One explores the clinical and biological principles underpinning rehabilitation practice in the context of neurological disablement. Section Two describes the assessment, treatment, and management of the major physical, cognitive and behavioural impairments, and the resulting functional deficits that may follow or accompany neurological disease. The final section explores in more detail these problems and their management in relation to the more common specific disorders of the nervous system. The text emphasises the fact that rehabilitation is an ongoing process involving multidisciplinary problem-solving, goal-setting and education, in which organised care is more effective than unorganised care; and the breakdown of professional barriers within rehabilitation, to facilitate the use of combined treatment techniques, improves outcome. It describes the contribution made by neural reorganisation and compensatory mechanisms to recovery of function, focusses on the avoidance of secondary deficit, and explores the physical, cognitive, affective and behavioural problems that may occur after neurological damage. At a time when new medical technologies threaten to fragment the integrity of medical care at individual and societal levels, it is crucial that all those involved in the management of chronic neurological disease have a working knowledge of the contents of this book. Their perspective on clinical practice will then be truly integrated and holistic and their patients will benefit accordingly.
