The laboratory guide directs students through a series of dissection activities for use in the lab accompanied by new, full color photos and figures. The guide can be used as a stand-alone dissection guide or in conjunction with any Anatomy and Physiology Laboratory Manual. Characterizing Pedagogical Flow presents conclusions from a multi-disciplinary, multi-national research project blending quantitative and qualitative approaches through a discourse methodology. The work produced portraits of mathematics and science education that were dramatically different for each of the countries involved: France, Japan, Norway, Spain, Switzerland, and the United States. To explain these differences, it is proposed that the interaction of curriculum and pedagogy is culturally unique and yields classroom learning experiences that are qualitatively different from country to country. This idea has profound implications for how international education research is interpreted.

The Bohensky Dissection Serieshas been used successfully by more than 300,000 biology students nationwide. Each book in the series is designed to guide the student through the study of anatomical structures. The books do this through the use of clearly marked photographs and illustrations. Accompanying text offers the student both easy-to-follow dissection instructions and factual information about the section under observation. At the end of each chapter there are tests which can be used for self-study or for grade course evaluation. Within the traditional dissection portion of a biology course, many programs include the sheep heart, eye, and brain. Within many of these guides, the author has incorporated photographs of these structures to more closely follow standard course curriculum. The author also provides important information on human organs such as the eye, ear, and heart. In this way, the student can better understand the role and function of these organs as they relate to human life processes. Add to this each book's large-size format, lay-flat spiral binding, and reasonable cost, and you can see why the Bohensky Dissection Series has become one of the most successful dissection guides used throughout this country's schools.

This concise lab manual is designed for those wanting a briefer and less expensive lab manual than traditionally available for the two-semester anatomy & physiology lab course and who also want their readers to develop critical thinking skills in the lab. Laboratory Investigations in Anatomy & Physiology, Pig Version, Second Edition contains only 31 exercises, providing just the core exercises done in most lab courses, in contrast to the 40 or 50 lab exercises included in the leading anatomy & physiology lab manuals.
