An electric current passing through a conductor produces a magnetic field around that conductor. The polarity and intensity of the magnetic field is dependent on the direction and size of current respectively. Motors make use of the magnetic effects to create forces between magnetic fields that in turn create motion.

This voltage drop principle leads to another important law in basic electrical engineering, Kirchoff's Voltage Law (KVL). This law states that the algebraic sum of the voltages in a closed loop is always equal to zero. If we only knew the supply potential and the voltage drop of  $R_1$ , we could use KVL to find the other voltage drop.
