which sheds light on the history of the various reduction debates in the philosophy of science and in the philosophy of mind, and on related topics such as reduction and unification, the notion of a scientific level, and physicalism. The book takes its point of departure in the examination of a puzzle about reduction. To

illustrate, the book takes as an example the reduction of water. If water reduces to H_2O , then water is identical to H_2O — thus we get unity. Unity does not come at the price of elimination — claiming that water reduces to H_2O , we do not thereby claim that there is no water. But what about diversity and directionality?

Read Free Psychoneural

Intuitively, there should be a difference between water and H₂O, such that we get diversity. This is required for there to be directionality: in a sense, if water reduces to H₂O, then H₂O is prior to, or more basic than water. At least, if water reduces to H₂O, then H₂O does not reduce to water. But

how can this be, if water is identical to H₂O? The book shows that the application of current models of reduction does not solve this puzzle, and proposes a new coherent definition, according to which unity is tied to identity, diversity is descriptive in nature, and directionality is the directionality of
