This examination of experimental research and clinical practice in behavior therapy focuses on the etiology and treatment of the most important psychological and mental health problems.

Traditional psychotherapy approaches, focusing on working with and correcting mental events and conditions, have placed little importance on the fundamentally physical nature of the person. Yet many of the problems people bring to therapy are linked with or manifested in the body--such as obesity, psychosomatic distress, chronic tension, and sexual problems. This book provides a therapeutic approach that addresses both the physical and mental nature of clients. In this book, James Kepner shows that a client's posture, movements, and bodily experiences are indeed relevant to therapy, and he offers an insightful framework for incorporating these aspects into a therapeutic framework. This comprehensive treatment explains how body work can be integrated with the aims, methods, and philosophy of psychotherapy, offering a framework within which practitioners of different theoretical approaches can better appreciate body processes in the context of the whole person, rather than as isolated events. This book, including an updated introduction by the author, explores the range of body work in psychotherapy, from the development of body awareness to intensive work with physical structure and expression. And it demonstrates how this approach can be particularly effective with a range of clients, including survivors of sexual abuse, recovering drug addicts or alcoholics, or those suffering from chronic illness.

The Analysis of Adolph Hitler, with Predictions of His Future Behavior and Suggestions for Dealing with Him, Now and After Germany's Surrender, was a two-hundred and forty page typewritten manuscript prepared for the wartime OSS, (Office of Strategic Services), by the Harvard Psychology Department under the supervision of Henry A. Murray, MD. The report was commissioned by the head of the OSS, William, "Wild Bill" Donovan and was done in collaboration with psychoanalyst Walter C. Langer, Dr. Ernst Kris of the New School for Social Research, and Dr. Bertram D. Lewin of the New York Psychoanalytic Institute. The report used multiple sources in profiling Hitler, including informants such as Ernst Hanfstaengl, Hermann Rauschning, Princess Stephanie von Hohenlohe, Gregor Strasser, Friedelinde Wagner and Kurt Ludecke. The work is considered a groundbreaking study and was the pioneer of offender profiling and political psychology, today commonly used by governments when assessing international relations.

This book covers the psychedelic ayahuasca tourism in Peru, with its facet-rich psychological, pharmacological, anthropological, and sociological aspects. The reader gets an interdisciplinary insight into the historical development and the current state of ayahuasca research. Findings from three empirical studies are presented, which the author has won in a 4-year field research: How do common standards develop in this particular form of psycho-spiritual tourism? Why are people from developed nations and urban centres heading to the Amazon to ingest the psychedelic beverage Ayahuasca? How do they experience such ceremonies and retreats? Which insights, personal meaning and effects do they gain and how do they integrate their experiences into the everyday life?
