The line's reduced profit rate is typically registered both in a declining output-capital ratio and a declining profit share, because, in arithmetical terms, it is simply the result of the higher-cost firms' inability to raise their prices

Surfing is a surface water pastime in which the wave rider, referred to as a surfer, rides on the forward part, or face, of a moving wave, which usually carries the surfer towards the shore. Waves suitable for surfing are primarily found in the ocean, but can also be found in lakes or rivers in the form of a standing wave or tidal bore. However, surfers can also utilize artificial waves such as ...

Starmer’s flip-flopping is giving Johnson a free ride. One month ago today, Keir Starmer appeared on the BBC to warn that the role of schools in fuelling the second wave of the coronavirus pandemic was ‘inevitable’ and ‘known’. This morning, he appeared on the BBC’s Marr programme to insist that schools must remain open:

This original book is a wide-ranging, radical and highly innovative critique of the prevailing orthodoxies within industrial relations and human resource management. It covers: * central problems in industrial relations * the mobilization theory of collective action * the growth of non-union workplaces and the prospects and desirability of a new labour-management social partnership * an historical account of worker collectivism, organization and militancy and state or employer counter mobilization * a critique of postmodernism and accounts of the end of the labour movement. Containing a detailed examination of the evolution of industrial relations, it argues that the area is often under-theorized and influenced by the policy agenda of the state or employers, and will prove informative reading for students of industrial relations.

Brest, 29 au 29 novembre 2000. C'est aujourd'hui une certitude que certaines vagues outrepassent en hauteur et en cambrure les prédictions fondées sur les modèles courants. L'amélioration de la compréhension des raisons, des mécanismes, et des circonstances de leur apparition se doit donc d'être une priorité de recherche. Le colloque Rogue Waves 2000 a rassemblé à Brest nombre des scientifiques et ingénieurs actifs sur le sujet, qui y ont trouvé l'occasion de confronter et discuter leurs avancées les plus récentes en termes de définition, de statistiques, de modélisation et de prédiction de ces vagues anormales. Mots-clés : vagues, extrêmes, non-linéarités, vagues anormales, vagues scélérates.

The omni-present low frequency wave motion (30-300 sec) contains a substantial fraction of the total wave energy inside the surf zone. A more complete description of nearshore wave processes considers incident short period waves superposed on, and interacting with, long standing waves. The wind waves are modulated in amplitude, wavenumber and direction due to relatively slowly varying depth changes caused by the long waves. The energy in the wind wave band is enhanced by side band growth at the sum and difference frequencies of short and long waves (order 15% at the shoreline). The modulation is identified in the analysis of field data as a positive correlation between the long waves and the wind wave envelope near the shoreline. Considering oblique incident waves, a steady longshore current showing a non-vanishing current at the shoreline is found as a result of the non-linear interaction between monochromatic incident and infragravity waves. An analytical solution describing the unsteadiness of the longshore current is developed. Keywords include: Infragravity, Longshore Current, Sediment transport, and Surf zone dynamics. (Theses).

"Considerable progress has been made in understanding the underlying mechanisms driving the long-wave behavior of the world socioeconomic development. In spite of this progress one recognizes that many aspects related with these underlying driving forces remained unsolved. One of these aspects endured, perhaps as the most controversial one: the close relationship between K-waves and the outbreak of major wars. Social scientists and politicians are well acquainted with the fact that chance events have been responsible for the outbreak of wars and their course and outcome. Two main trends are now acknowledged: the increasing recognition of the existence of some cyclical patterns of warfare involving the core of the world system, and a shift toward newly evolving patterns involving non-state actors and asymmetric warfare. We may tentatively agree that wars are not merely the result of blind social and political forces, but patterned according to long socioeconomic cycles and the result of deep and general laws underlying the co-evolutionary unfolding of the world system. In the first part of this book, the reader will find a mix of contributions dealing with new visions or revisions of the concept of long waves considered from very different perspectives related to

their unfolding. Those contributions discussing the issue of K-waves and their relation with military conflicts objectively, following old and / or new conceptualizations of the phenomenon, were selected to form the books second part. Finally those contributions with strong emphasis on the analysis of future scenarios, related or not related with warfare and / or world security compose the body of the third part."

Waves in Oceanic and Coastal Waters describes the observation, analysis and prediction of wind-generated waves in the open ocean, in shelf seas, and in coastal regions with islands, channels, tidal flats and inlets, estuaries, fjords and lagoons. Most of this richly illustrated book is devoted to the physical aspects of waves. After introducing observation techniques for waves, both at sea and from space, the book defines the parameters that characterise waves. Using basic statistical and physical concepts, the author discusses the prediction of waves in oceanic and coastal waters, first in terms of generalised observations, and then in terms of the more theoretical framework of the spectral energy balance. He gives the results of established theories and also the direction in which research is developing. The book ends with a description of SWAN (Simulating Waves Nearshore), the preferred computer model of the engineering community for predicting waves in coastal waters.

This book is intended as a handbook for professionals and researchers in the areas of Physical Oceanography, Ocean and Coastal Engineering and as a text for graduate students in these fields. It presents a comprehensive study on surface ocean waves induced by wind, including basic mathematical principles, physical description of the observed phenomena, practical forecasting techniques of various wave parameters and applications in ocean and coastal engineering, all from the probabilistic and spectral points of view. The book commences with a description of mechanisms of surface wave generation by wind and its modern modeling techniques. The stochastic and probabilistic terminology is introduced and the basic statistical and spectral properties of ocean waves are developed and discussed in detail. The bulk of material deals with the prediction techniques for waves in deep and coastal waters for simple and complex ocean basins and complex bathymetry. The various prediction methods, currently used in oceanography and ocean engineering, are described and the examples of practical calculations illustrate the basic text. An appendix provides a description of the modern methods of wave measurement, including the remote sensing techniques. Also the wave simulation methods and random data analysis techniques are discussed. In the book a lot of
