Taxonomy =science of classifying organisms--groups similar organisms together--assigns each a name
Naming Organisms: Organisms have common & scientific name
-all organisms have only 1 scientific name-usually Latin or Greek-developed by Carolus Linnaeus. This two-word naming system is called . Binomial Nomenclature-written in italics (or underlined)

**Taxonomy - The Biology Corner**

Taxonomy, in a broad sense the science of classification, but more strictly the classification of living and extinct organisms–i.e., biological classification. The term is derived from the Greek taxis (“arrangement”) and nomos (“law”).

**taxonomy | Definition, Examples, Levels, & Classification ...**

Modern taxonomy uses six kingdoms – Archaeobacteria, Eubacteria, Protista, Fungi, Plantae, & Animalia. Archaeobacteria & Eubacteria are unicellular prokaryotes lacking a nucleus, while Protista, Fungi, Plantae, & Animalia are all eukaryotes with a nucleus & membrane-bound organelles.

Principles of Taxonomy
1. Why is a system of classification needed?
a. Organize species into groups and discuss them.
b. Identify new organisms.
c. Show relationships between organisms.
2. Taxonomy is the science of classifying organisms.
a.

**Principles of Taxonomy Notes - PDF Free Download**

Taxonomy and Classification, Ziser Lecture Notes, 20044.
1. emphasized morphological characteristics as the basis for arranging specimens in a collection
2. each species is given a unique scientific name. while some species can have 100’s of common names each has only one binomial name.
3.

**taxonomy & Classification**

According to Mayr (1982), “Taxonomy is the theory and practice of classifying organisms”. Taxonomy is thus an information system comprising of classification, nomenclature, descriptions and identification.

**Taxonomy: Definition, Scope and Levels - Zoology Notes**

December 07, 2011Carl von Linnaeus: “The Father of Modern Taxonomy”
Our system of classification is based on his idea. He was the first to classify organisms into groups. He called his groups “taxa.”

**Taxonomy notes pdf - SlideShare**

The definition of a species is if two organisms can produce fertile offspring. Whilst some members of different species can reproduce to make offspring, the offspring are infertile and therefore classes as hybrids and not a species. E.g. a lion and a tiger can reproduce to make a liger or a tion. Two other factors than can also be considered too.

**Quick Notes on Plant Taxonomy - Biology Discussion**

In biology, taxonomy (from Ancient Greek τάξις (taxis) 'arrangement', and -νομία (-nomia) ' method ') is the scientific study of naming, defining (circumscribing) and classifying groups of biological organisms based on shared characteristics.

**Taxonomy (biology) - Wikipedia**

Taxonomy is the science of classification. Scientists classify organisms and assign each one a universally accepted name. Scientists classify because it is an organized way to communicate about the same organism all over the world. A classification system was developed because:

Presents lecture notes on plant taxonomy, provided by James L. Reveal, a professor in the Department of Plant Biology at the University of Maryland. Contains notes on the history of systematic botany, plant nomenclature, sources of taxonomic evidence, origin and classification, evolution and biosystematics, specimen preparation, and methods of identifying vascular plants. Includes information on specific families and systems of vascular plant classification.

Excerpt from Larval Taxonomy of the Troginae in North America: With Notes on Biologies and Life Histories (Coleoptera: Scarabaeidae)
This study of the immature stages was undertaken to help clarify the taxonomic status of the Troginae. The placement of the Troginae within the Scarabaeidae has varied with different workers. Certain workers, among them Edwards (1949) and Crowson have given the group family status. This writer is in agreement with those, among them Arnett Vaurie and Ritcher who would retain the group as a subfamily within the Scarabaeidae. Com parative studies on the larval musculature and larval nervous system are currently in progress and should aid in the systematic placement of the various subfamilies.3
The high degree of symmetry in the structures of the epipharynx and hypopharynx of Trax and Omorgus are indicative of the generalized condition. This is in agreement with the findings of Sharp and Muir who would derive the male aedeagus of all the scarabaeid subfamilies from that of the Troginae. About the Publisher
Forgotten Books publishes hundreds of thousands of rare and classic books. Find more at www.forgottenbooks.com
This book is a reproduction of an important historical work. Forgotten Books uses state-of-the-art technology to digitally reconstruct the work, preserving the original format whilst repairing imperfections present in the aged copy. In rare cases, an imperfection in the original, such as a blemish or missing page, may be replicated in our edition. We do, however, repair the vast majority of imperfections successfully; any imperfections that remain are intentionally left to preserve the state of such historical works.
