It traces the reluctance to allow infertility a past to a new tension that has emerged between utopian and anti-utopian fears about the growth rate and composition of population. The Stork and the Syringe argues that although doctors' approach to infertility is formed in response to the exigencies of the political economy of medical practice, it also accommodates a persistent gender bias: the tendency to regard women's bodies as inviting intervention and men's as demanding caution.

The Stork has many stories surrounding it, like in Aesop's (6th century BCE) fables The Farmer and the Stork and The Fox and the Stork. The first fable begins with a farmer plowing his fields, sowing his seeds and spreading his nets, these nets caught several cranes who hopped behind him picking up the seed.

Stork believed she had to defend Rajneesh, and was part of an attempted murder plot which at the time she felt would protect him. She discusses how she attempted to kill Rajneesh's doctor with a syringe filled with adrenaline, and also plotted to kill U.S. attorney Charles H. Turner.

Reproductive technology is typically discussed in the future tense. Yet doctors have always treated involuntary childlessness. This book looks at the recent history of infertility and the different ways medicine has treated it. It traces the reluctance to allow infertility a past to a new tension that has emerged between utopian and anti-utopian fears about the growth rate and composition of population. The Stork and the Syringe argues that although doctors' approach to infertility is formed in response to the exigencies of the political economy of medical practice, it also accommodates a persistent gender bias: the tendency to regard women's bodies as inviting intervention and men's as demanding caution. This bias is manifest in relation to gametes (eggs and sperm), sex hormones, in the form of medical investigations and treatment, and the frequency and enthusiasm with which the latter are carried out. Departures from this theme are rare and controversial, as the history of artificial insemination using donor semen demonstrates. This book is a major contribution to the history and sociology of reproduction, fertility, population and medicine.

This ground-breaking, interdisciplinary volume provides an overdue assessment of how infertility has been understood, treated and experienced in different times and places. It brings together scholars from disciplines including history, literature, psychology, philosophy, and the social sciences to create the first large-scale review of recent research on the history of infertility. Through exploring an unparalleled range of chronological periods and geographical regions, it develops historical perspectives on an apparently transhistorical experience. It shows how experiences of infertility, access to treatment, and medical perspectives on this 'condition' have been mediated by social, political, and cultural discourses. The handbook reflects on and interrogates different approaches to the history of infertility, including the potential of cross-disciplinary perspectives and the uses of different kinds of historical source material, and includes lists of research resources to aid teachers and researchers. It is an essential 'go-to' point for anyone interested in infertility and its history. Chapter 19 is open access under a CC BY 4.0 license via [link.springer.com](https://link.springer.com).

A unique interpretation of falling fertility in Britain between 1860 and 1940, with new and surprising findings.

This is the first transnational history of IVF and assisted reproduction. It is a key text for scholars and students in social science, history, science and technology studies (STS), cultural studies, and gender and sexuality studies, and a resource for journalists, policymakers, and anyone interested in assisted reproduction. IVF was seen as revolutionary in 1978 when the first two IVF babies were born, in the UK and India. Assisted reproduction has now contributed to the birth of around ten million people. The book traces the work of IVF teams as they developed new techniques and laid the foundations of a multi-billion-dollar industry. It analyses the changing definitions and experience of infertility, the markets for eggs and children through surrogacy, cross-border reproductive treatment, and the impact of regulation. Using interviews with leading IVF figures, archives, media reports, and the latest science, it is a vital addition to the field of reproduction studies. 'This pathbreaking account of the global forces behind the rapid rise of the fertility industry is the first to offer such a truly comprehensive overview of this hugely important topic.' –Sarah Franklin, Chair of Sociology, University of Cambridge 'In this compelling overview of one of the most significant technological and social interventions ever developed, the cultural and scientific imaginaries of assisted reproduction meet the obdurate histories of laboratory experiments, biological materials, and personal quests. It is an indispensable read for anyone interested in IVF and assisted reproduction.' –Andrea Whittaker, Professor of Anthropology, Monash University

BIRTH CONTROL, CONTRACEPTION, FAMILY PLANNING. Heralded as the catalyst of the sexual revolution and the solution to global overpopulation, the contraceptive pill was one of the twentieth century's most important inventions. It has not only transformed the lives of millions of women but has also pushed the limits of drug monitoring and regulation across the world. This deeply-researched new history of the oral contraceptive shows how its development and use have raised crucial questions about the relationship between science, medicine, technology, and society. Lara Marks explores the reasons why the pill took so long to be developed and explains why it did not prove to be the social panacea envisioned by its inventors. Unacceptable to the Catholic Church, rejected by countries such as India and Japan, too expensive for women in poor countries, it has, more recently, been linked to cardiovascular problems.

The cadaver industry in Britain and the United States, its processes and profits Except for organ transplantation little is known about the variety of stuff extracted from corpses and repurposed for medicine. A single body might be disassembled to provide hundreds of products for the millions of medical treatments performed each year. Cadaver skin can be used in wound dressings, corneas used to restore sight. Parts may even be used for aesthetic enhancement, such as liquefied skin injections to smooth wrinkles. This book is a history of the nameless corpses from which cadaver stuff is extracted and the entities involved in removing, processing, and distributing it. Pfeffer goes behind the mortuary door to reveal the technical, imaginative, and sometimes underhanded practices that have facilitated the global industry of transforming human fragments into branded convenience products. The dead have no need of cash, but money changes hands at every link of the supply chain. This book refocuses attention away from individual altruism and onto professional and corporate ethics.

A Companion to Contemporary Britain covers the key themes and debates of 20th-century history from the outbreak of the Second World War to the end of the century. Assesses the impact of the Second World War Looks at Britain's role in the wider world, including the legacy of Empire, Britain's 'special relationship' with the United States, and integration with continental Europe Explores cultural issues, such as class consciousness, immigration and race relations, changing gender roles, and the impact of the mass media Covers domestic politics and the economy Introduces the varied perspectives dominating historical writing on this period Identifies the key issues which are likely to fuel future debate

With technological advances in reproduction no longer confined to the laboratory or involving only the isolated individual, women and men are increasingly resorting to a variety of technologies unheard of a few decades ago to assist them in becoming parents. The public at large, and feminists as a group, are confused and divided over how to view these technologies and over what positions to take on the moral and legal dilemmas they give rise

to. Farquhar argues that two perspectives have tended to dominate feminist discussions of these issues. She labels these: "fundamental feminism" and "market liberalism." By linking a theoretical approach with a practical set of issues, Farquhar's *The Other Machine* provides a rigorous analysis of contemporary feminist debates.

It argues that women doctors were pivotal in developing a holistic approach to family planning and transmitting it across borders, playing a more prominent role in shaping scientific and medical knowledge than previously acknowledged. Illuminating women doctors' agency in the male-dominated field of medicine, this book reveals their practical engagement with birth control and later family planning clinics in Britain, their participation in the development of the international movement and their influence on French doctors. Drawing on a wide range of archived and published medical materials, Rusterholz sheds light on the strategies British female doctors used and the alliances they made to put forward their medical agenda and position themselves as experts and leaders.

So-called ovarian transplantations, performed in the early twentieth century, foreshadowed the modern practice of egg donation, and the first experiments in human in vitro fertilization date back to the 1930s. Marsh and Ronner also tell the little-known story of free and low-cost clinics in the urban North where low-income women were treated for infertility beginning in the nineteenth century.
