Spirals are actively forming stars and comprise a large fraction of all the galaxies in the local universe. Irregular galaxies, which have very little dust, are neither disk-like nor elliptical. Astronomers often see irregular galaxies as they peer deeply into the universe, which is equivalent to looking back in time.

Most galaxies are disk shaped and are tens of thousands of light years in diameter.

Galaxies are categorized by three broad shapes - spiral galaxies, elliptical galaxies and peculiar galaxies. It is estimated that observable universe has more than 100 billion galaxies.

learning research that helps students learn most efficiently. Topics include night sky, formation of planets, evolution of stars and galaxies, and structure of the universe, each with easy-to-understand illustrations.

Created with students in mind, this book works equally well for students taking classes assigned either the earlier 2nd or 3rd editions of this internationally published book, but at a much lower cost with updated information.

The epic, behind-the-scenes story of an astounding gap in our scientific knowledge of

the cosmos. In the past few years, a handful of scientists have been in a race to explain a disturbing aspect of our universe: only 4 percent of it consists of the matter that makes up you, me, our books, and every planet, star, and galaxy. The rest—96 percent of the universe—is completely unknown.

Richard Panek tells the dramatic story of how scientists reached this conclusion, and what they're doing to find this "dark" matter and an even more bizarre substance called dark energy. Based on in-depth, on-site reporting and hundreds of interviews—with everyone from Berkeley's feisty Saul Perlmutter and Johns

Hopkins's meticulous Adam Riess to the quietly revolutionary Vera Rubin—the book offers an intimate portrait of the bitter rivalries and fruitful collaborations, the eureka moments and blind alleys, that have fueled their search, redefined science, and reinvented the universe.

Offers advice on observing the stars and constellations, discusses useful equipment, and includes information on the moon, comets, eclipses, and planets

This book provides a comprehensive, self-

contained introduction to one of the most exciting frontiers in astrophysics today: the quest to understand how the oldest and most distant galaxies in our universe first formed. Until now, most research on this question has been theoretical, but the next few years will bring about a new generation of large telescopes that promise to supply a flood of data about the infant universe during its first billion years after the big bang. This book bridges the gap between theory and observation. It is an invaluable reference for students and researchers on early galaxies. The First Galaxies in the
