This article explains possible reasons for the following exit code: "task: non-zero exit (137)" With exit code 137, you might also notice a status of Shutdown or the following failed message: Failed 42 hours ago Resolution. The "task: non-zero exit (137)" message is effectively the result of a kill -9 (128 + 9). This can be due to a couple possibilities (seen most often with Java applications):

Container exits with non-zero exit code 137

Under some circumstances the OS returns exit status code 137 for processes, which were killed, instead of no status code. Dredd should count with that. I already tried to introduce a piece of code to handle that in commit 5975ddb, but it never got to master.

Treat exit status code 137 as "process killed" · Issue ...

I suspect the exit warning is printed out by the shell which called the perl program, not by the perl program itself, so "no warnings" in the perl code won't help you. exit code 137 means it was killed with a SIGKILL signal.

Why does my Perl script exit with 137? - Stack Overflow

An exit code, or sometimes known as a return code, is the code returned to a parent process by an executable. On POSIX systems the standard exit code is 0

File Type PDF Unix Process Exit Code 137 Maliphimetles Wordpress

for success and any number from 1 to 255 for anything else.

Linux and Unix exit code tutorial with examples | George Ornbo

How to deal with the exit codes of all piped commands. See [Bash Find out the exit codes of all piped commands](#) for more info. Conclusion. This page showed how to use exit codes on Linux or Unix based system and how to get the exit status/code of command. For more info see: [The exit status of a command](#); [Bourne Shell Exit Status Examples](#)

Bash get exit code of command on a Linux / Unix - nixCraft

There are no standard exit codes, aside from 0 meaning success. Non-zero doesn't necessarily mean failure either. `stdlib.h` does define `EXIT_FAILURE` as 1 and `EXIT_SUCCESS` as 0, but that's about it.. The 11 on `segfault` is interesting, as 11 is the signal number that the kernel uses to kill the process in the event of a `segfault`.

Are there any standard exit status codes in Linux?

Unix Process Exit Code 137 We have a batch Unix process that runs during the day and it is getting an exit code 11 from Unix. It finishes a `sqlplus` step and gets the exit code 11 before it starts the next step. This used to happen once a year and now is happening more often (but not every time the process runs). Resolve "Container killed on request."

Unix Process Exit Code 137 Maliphimetles Wordpress

Exit code 137 - Out of memory This is a Linux error code which you may see on CircleCI when your container runs out of memory. Containers are given 4GB of RAM by default. If your build process consumes all of the container memory, your build will fail.

Exit code 137 - Out of memory | CircleCI Support Center

The Linux Documentation Project is working towards developing free, high quality documentation for the Linux operating system. The overall goal of the LDP is to collaborate in all of the issues of Linux documentation.

Linux; 10 Comments. 1 Solution. 11,193 Views. Last Modified: 2012-12-10. We have a JVM that is stopping with an exit code 137 (128 + signal number for `SIGKILL`) and no application logs about the stop. I assume that the JVM would never kill itself, so this must mean that another process/user killed the JVM?
